

# New Test and Analysis Approaches for SEE Characterization

GOMACTech-10 24 March 2010

Dave Mavis, Paul Eaton, Mike Sibley, James Castillo, Don Elkins, Rich Floyd

Microelectronics Research Development Corporation 8102 Menaul Blvd. NE, Suite B Albuquerque NM 87110 505-294-1962

## Outline

- **□** Describe the Milli-Beam<sup>™</sup> raster scanning technique
  - Most recent test advance by Micro-RDC
  - New technique to raster scan complex integrated circuits
  - Spatial resolutions easily varied between 10 µm and 500 µm
  - Automated calibration, scanning, and data acquisition
  - Provides surface plot of IC error cross section as function of position

2

- **Show photos of the actual apparatus** 
  - As presently installed at the Berkeley 88-inch cyclotron
- Present examples of recent measurments
  - SRAM scan
  - DSET propagation chain scan
  - PLL loss of lock raster scan

- Precise collimation for use at the LBL cyclotron
  - New hardware and software to raster scan complex ICs
  - Achieve spatial resolutions between 10 μm and 500 μm
- Hardware
  - Primary square aperture (2-orthogonal slits) stepped <1 µm precision</li>
  - Secondary scattering cleanup aperture controlled from second stage
  - Displacement sensors provide error feedback signal for corrections
- Software
  - Computes coordinate transformations, sets beam position, controls run
  - Provide FPGA test board with positions for inclusion in error message
- Independent ICs for beam characterization and dosimetry
  - Homogeneous RAM for location and intensity profile measurement
  - Specially designed Beam monitor ICs placed upstream of aperture
  - At preset fluences: Stop data acquisition, step apertures, update FPGA test board with new position, resume data acquisition

#### Milli-Beam Schematic

- **Displacement and rotation of DUT w.r.t. calibration SRAM**
- **SRAM Y-axis rotation w.r.t. Milli-Beam Y-actuator**
- □ Non-orthogonally of Milli-Beam X and Y acutuators
- Berkeley Stage Y-axis rotation w.r.t. Milli-Beam Y-actuator<sup>†</sup>
- Non-orthogonally of Berkeley X and Y acutuators<sup>†</sup>
- Dimensional scaling of each actuator<sup>†</sup>

<sup>†</sup>Only if need to move Berkeley Stage to bring DUT into Milli-Beam Range

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{bmatrix} \cos_{y} & \sin_{y} \\ -\sin_{y} & \cos_{y} \end{bmatrix} \cdot \begin{pmatrix} x \\ y \end{pmatrix} \qquad \begin{pmatrix} x \\ y \end{pmatrix} = \begin{bmatrix} \cos_{y} & -\sin_{y} \\ \sin_{y} & \cos_{y} \end{bmatrix} \cdot \begin{pmatrix} x' \\ y' \end{pmatrix}$$

Milli-Beam Coordinate Transformations (2 of 4)

Non-Orthogonally Transformations

Axis Scaling

Milli-Beam Coordinate Transformations (4 of 4)

**Transformation to compute Milli-Beam raster scan movements**

- $_{\mu} \rightarrow$  SRAM w.r.t. Milli-Beam;  $D \rightarrow$  DUT w.r.t. SRAM

- $\{ \rightarrow \text{Berkeley w.r.t. Milli-Beam}; b \rightarrow \text{Berkeley stage movement} \}$
- Inverse transformation used to compute DUT location, along with an estimate of the variance, for each Milli-Beam raster position

#### **Beam Fluence Monitor**

- **Given Special ICs** 
  - Mounted just upstream of the Milli-Beam Primary Aperture
  - Incorporates several chains of RS flip-flops
  - Electrically selectable cross section
  - Extremely small dead time
- **Calibrated to an accuracy of better than 1%** 
  - Independent of the Berkeley scintillator system
  - Aperture of know size (as measured on a 90 nm SRAM)
  - Particle detector counts individual heavy-ions through aperture
  - Beam monitor IC events measured as a function of LET

## **Complete Milli-Beam Assembly**

## **Aperture Mounting Assembly**

### **Aperture Construction**

### View as Seen by the Heavy-Ion Beam

Average the 4 monitor chip counts to predict beam flux at aperture

- **100 µm square aperture**
- Located 40 cm to SRAM
- Edge washout due to angular spread

- □ 100 µm square aperture
- Located 5 cm to SRAM
- Sharper edge definition

- **2**-d Convolution of a Gaussian product z(x)iz(y) with an x-y-z box
- □ Center, width, length of aperture determined to < 1 µm accuracy
- **Gaussian**  $\uparrow_x$  and  $\uparrow_y$  determined to <0.1 µm accuracy
- † values again match distance times tangent of 0.0025°
- ☐ † at 5 cm distance measured to be ~2 µm in x and y directions

## **Example of a Raster Scan**

- **114 μm x 101 μm aperture** 
  - As determined from LSQ fit
- **5** cm from SRAM
- $\square$  >>1 x 10<sup>6</sup> Ar ions/(cm<sup>2</sup>-sec)
  - 10x normal beam intensity
- □ Use aperture size for step size
  - Ux step = 114 μm
  - Uy step = 101 μm
- **Scan in a serpentine pattern** 
  - ~1.5 seconds/step
  - ~300 errors at each position

- **Scan an SRAM on one of our earlier test chips** 
  - Two different cell designs hardened layout on right half
  - Decode locations clearly seen in center of each array
  - Variations outside of statistical uncertainties due to beam fluctuations
  - Demonstrates the need to perform independent fluence monitoring

- Scan a clocked prop-chain test circuit from a DSET test chip
  - 12 different chains, propagate in y direction along an x serpentine
  - Scan a 50 µm wide slit in 50 µm steps along y-direction
  - Pulse broadening can be clearly seen from the data

- Scan a 100 µm square beam over the PLL circuitry
  - Better approach than trying to test standalone circuit components
  - Monitor lock signal and measure recovery time

Microelectronics Research Development Corporation

Correlate observed errors to specific circuits (CP, VCO, PSD, /N, ÎM)

## Correlate PLL Errors to Physical Layout

**Design Layout** 

**Milli-Beam Error Contours** 

## Summary

- New test methods
  - Full characterization of SRAM MBUs
  - True 90° heavy-ion irradiation
  - Accurate Milli-Beam raster scanning
- Versatile data acquisition system
  - FPGA-based mother board with inexpensive daughter cards
  - VHDL test programs to record detailed descriptions of each error
  - LabView user interfaces to control raster scans and provide real-time visualization
- Test specific data analysis
  - Perl scripts to parse and post-process data log files
  - Reduced data readied for graphical display and least squares fitting
  - Proper treatment of data uncertainties
  - Curvature matrix based least squares parameter extraction
  - Extraction of parameter variance
  - Correct propagation of errors when using extracted parameters
